## WIRING INFORMATION

- Multiple 24V DC fixtures can be connected to a single driver in parallel only.
- The total connected load of a circuit should not exceed the maximum driver load rating.
- We recommend running drivers at 80% of their maximum load rating to ensure heat and output performance are maximized.
- The required DC cable size should be calculated based on the connected load, cable length, voltage and allowable voltage drop percentage.
- Maximum Amp rating of the selected cable should be considered based total connected load.
- We recommend using a twin Sheath Automotive cable with a high strand count where applicable.
- Please note that industry standard sizes do not match actual cable cross section area (CSA) measured in mm<sup>2</sup> that is required for voltage drop calculations.
- The Below table illustrates typical cable sizes in mm<sup>2</sup>, connected loads in Watts and their associated maximum cable lengths in meter, based on a allowable voltage drop of 5%.
